

Editor Guide

Update your site instantly, no tech skills needed

How this works

Your site has its own private control panel called Admin Styles. Open it, type what you want changed (or click a ready-made option), and hit Send. An AI updates your site's settings and puts the new version live automatically, usually within about a minute. No copying text into ChatGPT, no build scripts, nothing to install.

1. Opening Admin Styles

Admin Styles is the file `admin_styles_sample_business.html` you were given -- double-click it and it opens right in your browser (Chrome, Safari, Edge, whatever you use). There's nothing to install and nowhere to log into online -- it runs from the file itself.

2. The four tabs

Tab	What it's for
Content & Preview	Type a request in plain English and watch your site's preview update as you go.
Style Editor	Change colors and fonts with simple pickers -- saves automatically, no request needed.
Add-ons	A browsable gallery of ready-made touches (bouncy buttons, an expandable menu card, and more), each
Activity	A log of every change that's been made, each with a one-click Undo.

3. Sending your first change

The first time you hit Send, it asks for your site's access code -- a separate one-time code that came with the file (not a password, and not something you need to remember day to day). Enter it once and the browser remembers it after that.

4. Things you can ask for

- “Our hours changed -- we're open until 10pm now, update the site.”
- “Change the special to 15% off this week.”
- “Update the phone number everywhere it appears.”
- “Swap the storefront photo for this new one: [paste an image link].”
- “Reword the second feature card to mention our daily deals.”

Tip — plan your changes, then submit them together. Every request rewrites your whole settings file, even for a one-line change, so five separate one-line requests cost roughly five times what one request covering all five changes does. Jot down everything you want updated first, then ask for it all at once: “Update our hours to 11-10, change the special to 15% off Tuesdays, and update the phone number to (541) 555-0100.”

5. Using the Add-ons tab

The Add-ons tab is a browsable gallery of small site touches -- things like bouncy buttons, an expandable menu card, a gliding tab highlight, or a countdown timer. Every card shows a live, working sample right on the page, so you can see exactly what it does before asking for it. Found one you like? Click Add to my site -- it fills in a precise, ready-to-send request on the Content & Preview tab. A few need you to fill in a bracketed detail first (like an announcement's exact wording) -- review the request, then hit Send.

6. Confirming it went live

- After you hit Send, the status pill at the top shows “Redeploying your site...” -- give it a minute to finish.
- Refresh your live site and confirm the change is there.
- Every change is logged on the Activity tab with a timestamp, so you can always see what changed and when.

7. If something looks wrong

Open the Activity tab, find the change, and click Undo -- it reverts your site to how it looked right before that request and redeploys automatically. No need to describe what went wrong or ask anyone to fix it by hand.

No computer handy?

Just email your change to whoever gave you this guide, exactly as you'd say it out loud -- "we're open till 10 now", "new special: 15% off Tuesdays" -- and they'll send it through Admin Styles for you, same day.
